

GEOPHYSICAL RESULTS: KIZILTEPE

Accompanying Image

Figure 1: Inverse model resistivity (top) and chargeability (bottom) profiles on Line 7 viewed looking to the southeast. The left-hand side of the sections correspond to the continuation of the Arzu structure beneath ignimbrite cover and identify a moderately dipping anomaly at a depth of 50-100m below surface. The high chargeability anomaly containing several steeply dipping resistivity features on the right-hand side is an obvious drilling target.
